

6. Task on EC2:

=====

1) Launch one EC2 using the Amazon Linux 2 image and add a script in user data to install Apache.

≡ [EC2](#) > [Instances](#) > Launch an instance

Allow tags in metadata | [Info](#)

Select ▼

User data - *optional* | [Info](#)

Upload a file with your user data or enter it in the field.

[Choose file](#)

```
#!/bin/bash
# switch to root user
sudo su
# update the system
yum update -y
# install httpd.service
yum install httpd -y
# start httpd.service
systemctl start httpd
# enable httpd.service
systemctl enable httpd
# for creating an index.html file
echo " <h1>hello world!<h2> welcome to techie horizon...">/var/www/html/index.html
# to provide permissions to index.html
chmod 777 /var/www/html/index.html
```

hello world!

welcome to techie horizon...

define all the details like name--select ami (amazon linux2)--select keypair--create a security group with http and ssh enabled--scroll down and click advanced configuration--user data info (paste the code)

bash script to install httpd from userdata

```
#!/bin/bash
```

```
sudo su
```

```
yum update -y
```

```
yum install httpd -y
```

```
systemctl start httpd
```

```
systemctl enable httpd
```

```
echo "<h1>hello world!<h2>welcome to techie horizon.../var/www/html/index.html
```

```
chmod 777 /var/www/html/index.html
```

2) Launch one EC2 using the Ubuntu image and add a script in user data to install Nginx.

User data - *optional* | [Info](#)

Upload a file with your user data or enter it in the field.

 Choose file

```
#!/bin/bash
sudo su
apt update -y
apt install nginx -y
systemctl start nginx
systemctl enable nginx
echo "<h1>hello everyone!<h2>welcome to my nginx
server...>/usr/share/nginx/html/index.html
chmod 777 /usr/share/html/index.html
```

Welcome to nginx!

If you see this page, the nginx web server is successfully installed and working. Further configuration is required.

For online documentation and support please refer to nginx.org.
Commercial support is available at nginx.com.

Thank you for using nginx.

launch instance--define name--select ubuntu ami--select keypair--select security group with
http--advanced details--user data(paste the script)

```
#!/bin/bash
```

```
sudo su
```

```
apt update -y
```

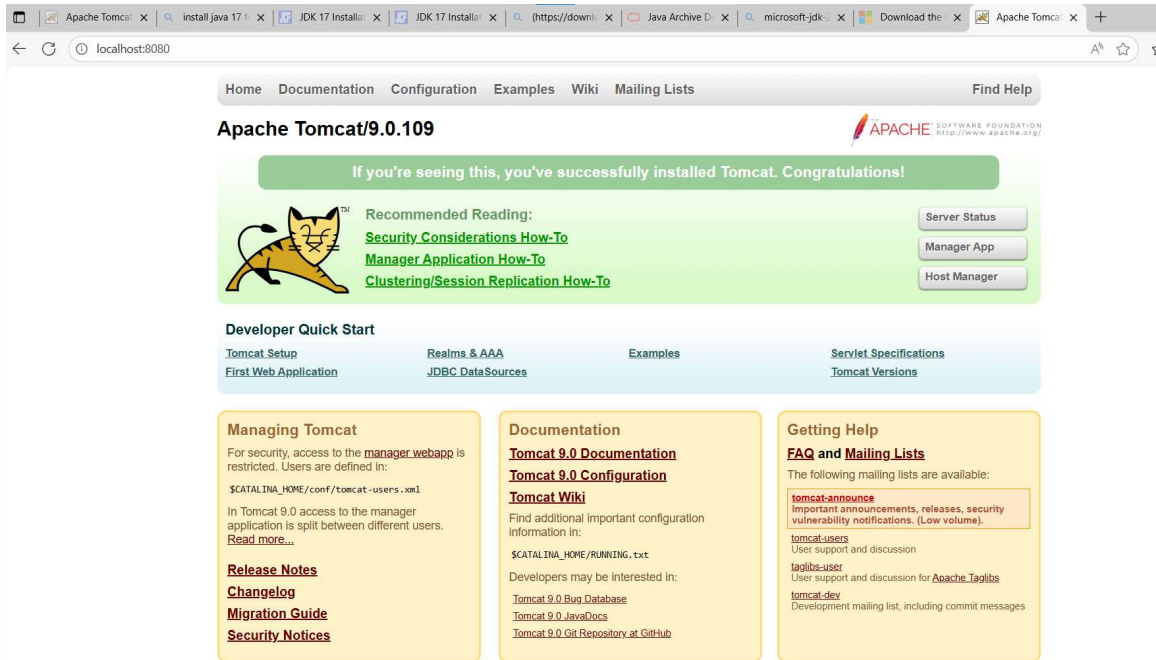

```
apt install nginx -y
```

```
systemctl start nginx
```

```
systemctl enable nginx
```

```
chmod 777 /usr/share/html/index.html
```

3) Launch a Windows server and install Tomcat in Windows.

steps:

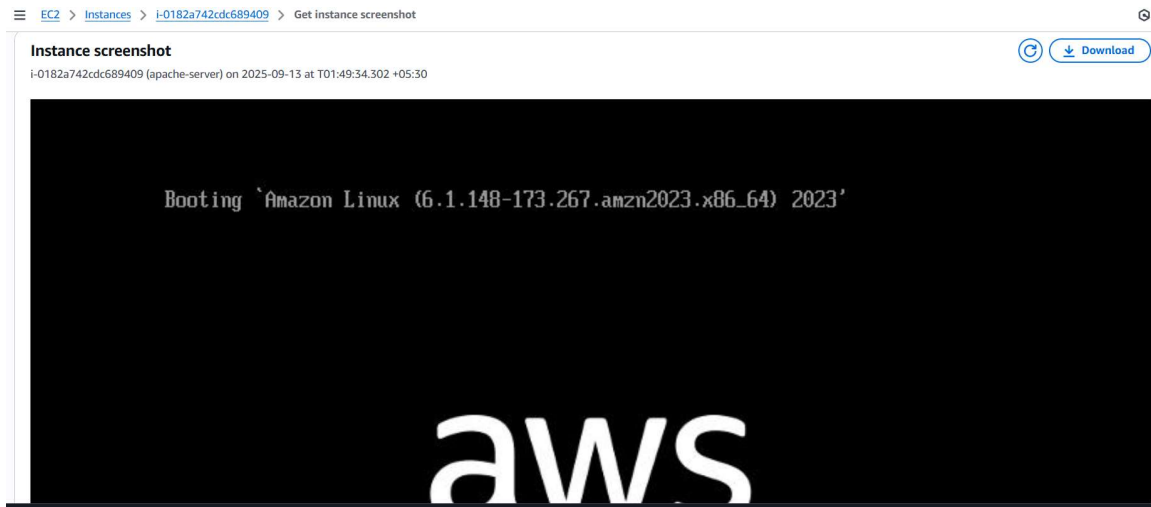

- launch an instance---name---microsoft windows(under ami)---key pair---security group inbound ports tcp:8080,http:80 and rdp:3389---then launch
- then connect using rdp---download remote desktop file---upload private key and decrypt password---copy the password
- after downloading the remote file (msi file)you need to paste the password there then
- download java-17 (<https://aka.ms/download-jdk/microsoft-jdk-17.0.16-windows-x64.msi>) then install it
- download tomcat
<https://dlcdn.apache.org/tomcat/tomcat-9/v9.0.109/bin/apache-tomcat-9.0.109.exe>
- then install it on same directory where your java is installed (c: \Program Files\Microsoft\jdk-17.0.16-hotspot
- then a folder get created automatically C:\Program Files\Apache

Software Foundation\Tomcat

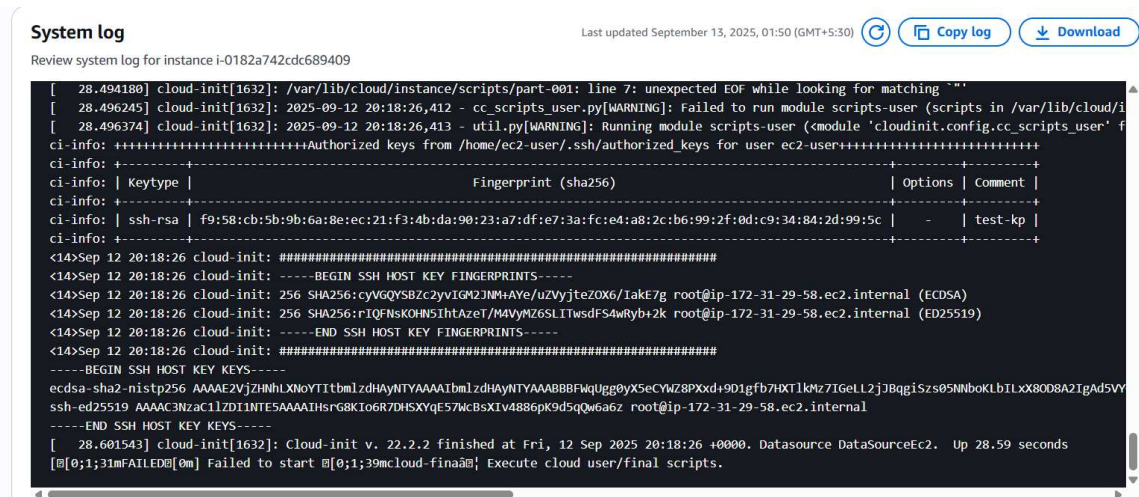

- go to bin directory start the tomcat manually and check it on internet using web url localhost:8080

4) Take a snapshot of the instance created in Task 1.

screenshot/system snapshot

system log:

5) Assign passwordless authentication for the EC2 created in Task 2

```

[root@ip-172-31-16-234 /]# useradd techie
[root@ip-172-31-16-234 /]# passwd techie
Changing password for user techie.
New password:
BAD PASSWORD: The password is shorter than 8 characters
Retype new password:
passwd: all authentication tokens updated successfully.
[root@ip-172-31-16-234 /]# cd /root/ssh
bash: cd: /root/ssh: No such file or directory
[root@ip-172-31-16-234 /]# cd /root/.ssh

#GSSAPIKeyExchange no
#GSSAPIEnableK5users no

```

6) Launch any EC2 using the spot purchasing option.

EC2 > Spot Requests > Create Spot Fleet request

☐ Specify instance attributes that match your compute requirements

☒ Manually select instance types

Fleet request
Amazon EC2 requests your target capacity from these instance types. The more instance types that you specify, the better your chances of having your target capacity fulfilled.

Delete

Add instance types

<input type="checkbox"/>	Instance type	vCPUs	Memory (GiB)	Spot price	Savings off On-Demand
<input type="checkbox"/>	c5.large	2	4	\$0.0329	61.29%
<input type="checkbox"/>	c6in.24xlarge	96	192	\$1.9268	64.60%
<input type="checkbox"/>	m8i.12xlarge	48	192	\$0.6079	76.07%
<input type="checkbox"/>	m7i-flex.12xlarge	48	192	\$0.8066	64.90%
<input type="checkbox"/>	r7a.2xlarge	8	64	\$0.1995	67.22%
<input type="checkbox"/>	r5.24xlarge	96	768	\$1.916	68.32%
<input type="checkbox"/>	r7iz.12xlarge	48	384	\$1.576	64.70%
<input type="checkbox"/>	r7iz.8xlarge	32	256	\$1.0364	65.17%
<input type="checkbox"/>	c5ad.24xlarge	96	192	\$1.3811	66.54%

☒ Fleet strength: Strong

aws

Search [Alt+S]

EC2 > Instances > Launch an instance

Purchasing option | Info

☐ None

☐ Capacity Blocks
Launch instances for your active capacity blocks

☒ Spot instances
Request Spot Instances at the Spot price, capped at the On-Demand price

Discard Spot instance options

Spot Instance Options | Info

Specify Spot Instance Options such as Maximum Price, Request type, expiration date and interruption behavior

Maximum price | Info

☒ No maximum price
Request Spot Instances at the Spot price, capped at the On-Demand price

☐ Set your maximum price (per instance/hour)

Request type | Info

Persistent

Valid to | Info

☐ No request expiry date
The default value is no expiry date

☒ Set your request expiry date

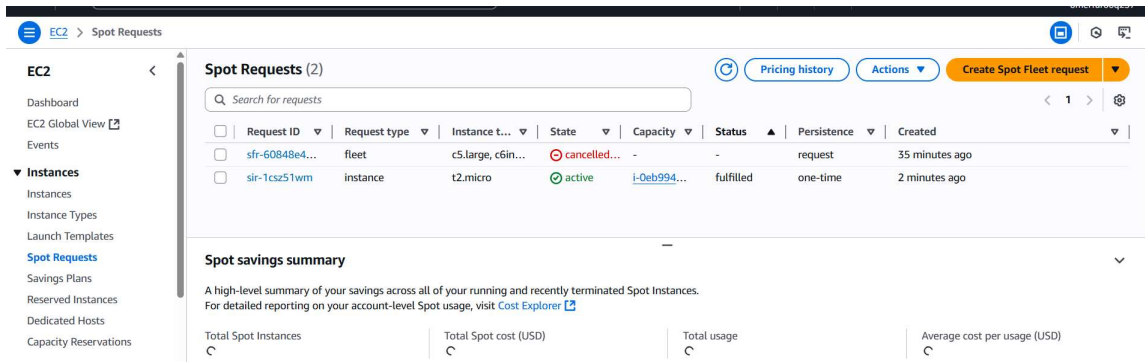

2025/09/17

17:00

GMT+5:30

Interruption behavior | Info

Select

steps:

launch an instance

define all details

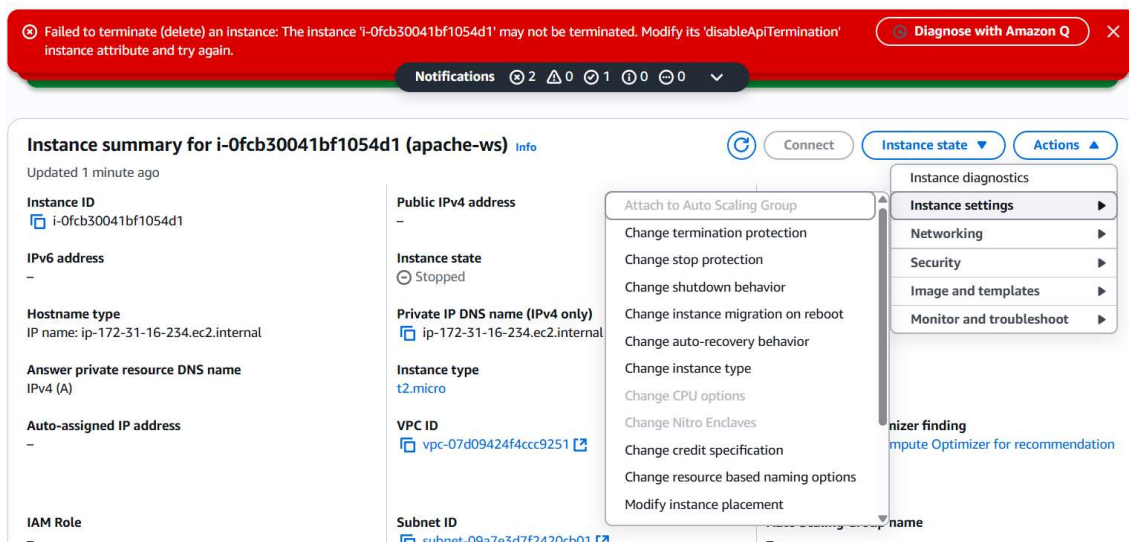

go to additional details

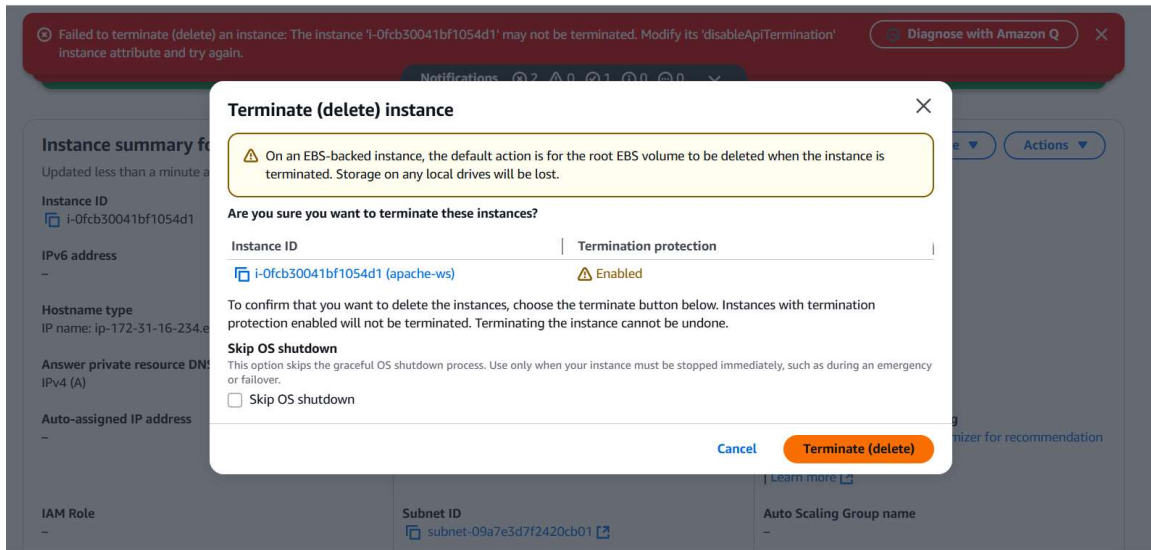

purchasing options----select spot instance

and you can define all details like expiry and standard price per hour

launch instance

7) Enable Termination policy on EC2 created in Task 2.

go to actions

edit instance settings

enable termination protection and save

now try to terminate the instance you will find error message...

similarly you can change the stop protections, shutdown behaviour, auto recovery behaviour and more...

8) Launch one EC2 using AWS CLI.

download aws cli <https://awscli.amazonaws.com/AWSCLIV2.msi>

go to gitbash then

aws configure----add access id, access key, region and format (access credentials is available----profile---credentials---accesskey_id----accesskey_password)

default location of storing aws config details: ~/.aws/ here we find two files aws config and aws credentials and we can modify these files also

aws ec2 describe-instances----to check all details of your instances on aws

script to launch an instance:

to create a key pair:

```
aws ec2 create-key-pair --key-name cli-kp --  
query 'keyMaterial' --output text > cli-kp.pem
```

to create a security group:

```
aws ec2 create-security-group --group-name  
MySecurityGroup --description "My security group"
```

to create ssh protocol:

```
aws ec2 authorize-security-group-ingress --group-  
name MySecurityGroup --protocol tcp --port 22 --  
cidr 0.0.0.0/0
```

to create http protocol:

```
aws ec2 authorize-security-group-ingress --group-  
name MySecurityGroup --protocol tcp --port 80 --  
cidr 0.0.0.0/0
```

to create an instance

```
aws ec2 run-instances --image-id  
ami-08982f1c5bf93d976 --count 1 --instance-type  
t2.micro --key-name cli-kp --security-groups  
MySecurityGroup
```

```
aws ec2 describe-instances----to view our instances
```

```
